

SABRE Vision TV1000 combines the very latest in touch screen and multimedia computer technology with the timeless elegance of sculpted wooden furniture.

With a choice of over 20 wooden veneers and 300 high pressure laminates, the **TV1000** can be crafted to match corporate furniture - maybe in dark oak for example, as used in the Charles Dickens Museum or light maple for hotel receptions or in silver for a hi-tech look.

This stylish kiosk is typically used in high profile indoor environments, such as foyers or museums to provide visitors with information web site access or multimedia presentations.

The large, bright TFT display provides crystal clear images that will catch the eye of casual observers, as well as providing detailed information for interactive users. The touch screen is simple to operate and provides users with a robust and highly intuitive interface with the information point.

The design of the **TV1000** has been optimized for use by people of varying heights and is both a delight to use and attractive to look at.

For ease of maintenance and to achieve minimum costs, standard PCs and standard PC peripherals are used whenever possible. A lockable compartment in the rear of the unit has been designed to accept a slimline, desktop PC.
