

The **SABRE Vision TV5000** is the low cost way to implement indoor kiosk projects. This simple kiosk is constructed in 2mm sheet metal; robust enough for demanding applications such as airports and public information points and is DDA compatible. It's not pretty but it does the job splendidly.

TV5000 is designed to be space saving but still offers a wide range of peripherals and choice of 15" or 17" LCD screens with or without touch.

A deeper cabinet version provides extra space for fitting peripherals:- standard keyboard or a keyboard with trackball, printers, speakers, card readers etc. With these options, the **TV5000** may be used as a complex interactive information point.

The cabinets are supplied in a silver finish but custom colours and graphics may be added for any quantity.

A compartment for a standard small PC is accessed from the front and locked with a security rod lock. For ease of maintenance and to achieve minimum costs, standard PCs and standard PC peripherals are used whenever possible.
